International Seminar on Livestock Production and Veterinary Technology 2016

Indonesian Center for Animal Research and Development under the Ministry of Agriculture Republic of Indonesia are pleased to announce an International Seminar on Livestock Production and Veterinary Technology. The theme of the seminar is Promoting Livestock and Veterinary Technology for Sustainable Rural Livestock Development.

The depletion of resources, emergence of new diseases and climate change are important factors that affect the sustainable development of rural livestock. Through the application of livestock and veterinary technologies, these factors can be reduced to enhance the sustainability of livestock production in the countryside. Under this condition, livestock technologies that are produced should be based on optimizing the use of local resources, including plant and animal germplasm, utilization of agriculture waste, crop-livestock system as well as minimizing energy waste. Development of local breed of livestock and forages that adaptive to the climate change is also required. Veterinary technologies including development of new vaccine, medicine, rapid identification test etc., are the demand to face sustainability of rural livestock production. Studies on policy to support all of the innovation to be implemented in the field are also needed. All of these issues will be discussed in this seminar.

The seminar provides you with an excellent opportunity to share your expertise and experiences and to identify challenges and explore with colleagues innovative solutions for the benefit of all conference delegates. The seminar will be held in Bali, one of the Paradise Island of Indonesia.
